

Yealink Delivers Efficiency to Russia's Largest Transportation Company

Upgraded and Efficient Communication in Need

As Russia's largest private oil transportation company, Transoil has an extensive network with over 20 offices and branches across the nation. An organization of this size, a wide amount of internal and external communication is needed, from daily meetings to critical collaboration. Easy and efficient communication among different branches throughout the nation plays a crucial role in daily operation.

Transoil has already deployed 800 Avaya phones during the past 10 years, and it wants to introduce video conferencing to the company. Therefore, compatibility with the company's current Avaya system is a must.

Transoil asks for two-way communication from Avaya phone system to YMS and vice versa. However, since the system is very old, and there is no Avaya support in Russia due to sanction, compatibility test is a big challenge.

Moreover, switching from audio to video, Transoil has high demands for rich meeting features like advanced meeting control. Also the scalability of upgrading to big quantity infrastructure in future is crucially important.

About Transoil

Established in 2003 in Saint-Petersburg, Transoil is the largest private rail operator of rolling stock and has the largest market share in the segment of rail transport of oil and oil products in Russia. The total volume of transported goods exceeds 570 million tons.
